

eDiscovery Solutions in MS Purview

eDiscovery is the process of identifying and delivering electronic information that can be used as evidence in a legal case. eDiscovery tools in Purview can search for content in:

- Exchange Online
- OneDrive for Business
- SharePoint Online
- Microsoft Teams
- Microsoft 365 Groups
- Yammer Teams
- Mailboxes and sites

There are 3 eDiscover solutions:

- Content Search: search for content across M365 data sources and export search results locally
- eDiscovery Standard: builds on the basic search and export functionality by allowing you to create eDiscovery cases and assign managers. You can also associate searches and exports with a case and put a hold on content relevant
- eDiscovery Premium: same as above, but is more end to end (identify, preserve, collect, analyse, export). Lets legal teams be involved fully.

Audit solutions

Purview provides two audit solutions:

- Standard: log and search for audited activities (enabled by default, thousands of audited events, 90 retention, access via GUI, cmdlet and API)
- Premium: longer retention of audit records, custom retention policies, higher bandwidth access to API

Licensing for audit Standard and Premium requires appropriate org level sub and corresponding per-user license.
